

Project Idea 1

Title: Grocery Store Management System

Feature 1: Category & Product Management

Shows multiple product categories (Staples, Spices, Dairy, Dry Foods) and items under each category with their prices. When a category is selected, the system retrieves all product details (names, prices) and displays the list with prices. If the user enters an invalid category code or number, the system detects it and asks them to re-enter.

Feature 2: Add Item & Remove Last Item by user

Users can add multiple items to purchase. The system stores the item's price and updates the running total. If a mistake is made, the user can remove the last added item, and the system subtracts its cost from the total.

Feature 3: Discount & Payment System

The system checks eligibility for discounts (minimum amount 500tk).
If eligible, the user enters a discount code(2345). After discount is applied, the user selects payment type: Cash payment and Cash on delivery.

Feature 4: Search Product and Filtering

The user can search for items in two ways: (1) by entering the first letter of a product name (partial match), or (2) by selecting a category from the menu (category-based match). When a search is performed, all products in the matched category are displayed with prices. From the search results, users can select and add items (1-3) directly to their cart, just like the browse feature. If no valid selection is made, the system shows an error message. After each search, the system asks "Search Again? (Y/N)" . pressing Y restarts the search, and pressing N returns to the main menu.

Feature 5: Customer Review & Rating System (1–5 Scale)

After completing a purchase, the system allows the customer to leave a rating from 1 to 5.
The program validates the input to ensure the rating is within the allowed range.
Each rating is stored in memory, and the system calculates an updated average store rating every time a new review is added.

Feature 6: Daily Report: View Business Metrics

Protected by PIN-based login (PIN: 1234). After successful login, one can view total transactions completed, total revenue generated in TK, average customer rating from reviews, and total count of customers who rated the store. Incorrect PIN denies access and returns the user to the main menu.
